                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 15
S20538
chilin synthase (EC 2.4.1.16) CHS2 - yeast (Candida albicans)
C; Species: Candida albicans
C; Species: C; Scott S20538; A38192
R; Chen-Wu, J.L.; Zwicker, J.; Bowen, A.R.; Robbins, P.W.
Mol. Microbiol. 6, 497-502.1992
A; Title: Expression of Chilin synthase genes during yeast and hyphal growth phases of Candidates preliminary
A; Reference number: S20538; MuID:9219994
A; Status: Preliminary
A; Molecule type: DNA
A; Residues: 11009
C; CHS
A; Cross-references: GB: MB2937; NID:9170844; PIDN: AAB59308.1; PID:9170845

TASE ACTIVITY THAT NINCES DNA 3' TO THE LESION.
TO CATALYTIC ACTIVITY: ENDONUCLEOLYTIC CLEAVAGE NEAR APURINIC OR APVENTIONING SITES TO PRODUCTS WITH 5' PHOSPHATE.

TO SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

TISSUE SPECIFICITY: HIGHEST EXPRESSION IN TESTIS.

TISSUE SPECIFICITY: HIGHEST EXPRESSION IN TESTIS.
"Genomic structure and chromosomal localization of the mouse Oggl gene
that is involved in the repair of 8-hydroxyguanine in DNA damage.";
                                                                                                                         Seeberg E.; "Opposite base-dependent reactions of a human base excision repair "Opposite base-dependent reactions"; enzyme on DNA containing 7,8-dihydro-8-oxoguanine and abasic sites."; EMBO J. 16:6314-6322(1997).

"Cloning and characterization of a rat 8-oxoguanine-DNA-glycosylase.";

"Cloning and characterization of a rat 8-oxoguanine-DNA-glycosylase.";

Submitted (OCT-1997) to the EMBL/GenBank/DDBJ databases.

-i. FUNCTION: DNA REPAIR EWEXME THAT INCIEES DNA AT 8-OXOG RESIDUES.

EXCISES 7, 8-DIHYDRO-8-OXOGUANINE AND 2,6-DIAMINO-4-HYDROXY-5-N-METHYLPORAMIDOPPREMIDINE (RAPY) FROM DAMAGED DNA. HAS A BETA-INTASE ACTIVITY THAT NICKS DNA 3' TO THE LESION.

-i. CATALYTIC ACTIVITY: ENDONUCLEOLYTIC CLEAVAGE NEAR APURINIC OR APPERMIDINIC SITES TO PRODUCTS WITH 5'-PHOSPHATE.

-i. SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

                                                                                                                                                                                                                                COUPLED TO ATP SYNTHESIS.

-!- COFACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN.

-!- SUBGUIT: THE MAIN SUBGUITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN.

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                        This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This peptide represents a linear derivative of the protegrin family of peptide antibiotics. agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein from M. tuberculosis, M. smegmatis and Salmonella typhimurium. The methods and products can be used for the detection of mycobacterium and for the treatment of mycobacterial infections. They can also be used for the design of compounds for treating mycobacterial infections, e.g. tuberculosis. Administration of ligands of mycobacterial arylamine NAT, together with isoniazid may increase its effectiveness against other pathogenic mycobacteria, such as M. leprae which causes leprosy of M. bovis which infects cattle. The present sequence represents the

The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, machanisms the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                   New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protegrin; antibiotic; antimicrobial; antiviral; antibacterial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The newel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cytoplasm and non-liver active agents to consist the derivative agents including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                   Linear; protegrin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm; nucleus; blood-brain barrier
